

Success Story
City of Blaubeuren

Organisation under monument protection. A key management for every building.

Introduction - our client:

The municipal administration of Blaubeuren with its approximately 70 employees is committed to the well-being of its almost 12,000 citizens on a daily basis. Four offices, the financial administration, the main office, the municipal construction office as well as the citizens' service and the administration of public order take care of the organisation and administration of the picturesque town in the east of Baden-Württemberg.

The building construction department in particular is responsible for the supervision and building management of the city's own buildings, including schools and kindergartens.

The challenge:

The key management of the city of Blaubeuren becomes an organisational challenge, especially due to its many different departments.

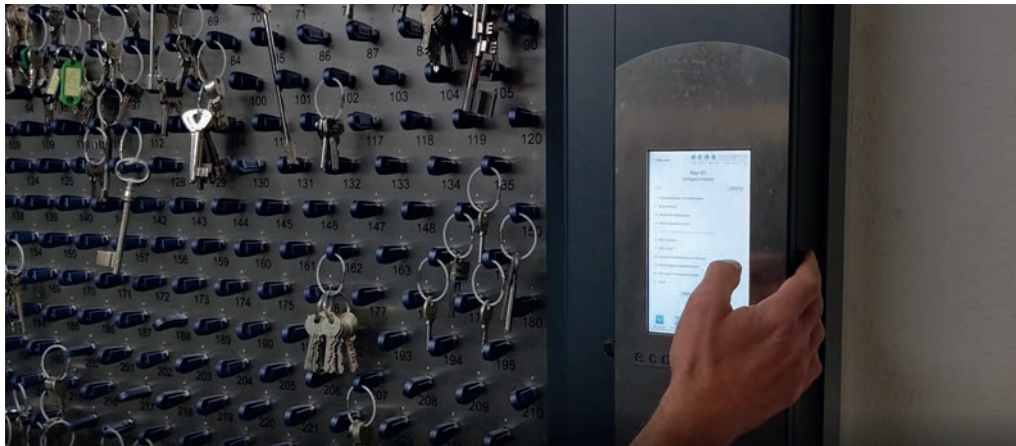

In the past, all the keys of a department, such as the cemetery administration, were stored with the responsible officer. If these were then in turn handed out or passed on to individual employees without further documentation, individual keys could often not be found promptly when needed. Since the keys were usually copied or exchanged immediately in such cases, the city was regularly confronted with high costs.

An additional challenge was that the building construction department is located directly in the city's listed town hall. Thus, construction measures such as laying cables cannot be carried out without further ado, which makes the installation of technical equipment more difficult.

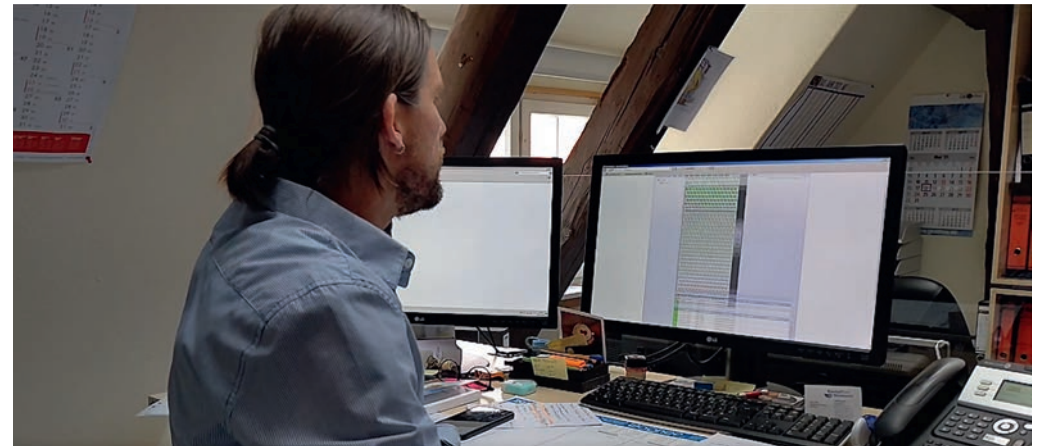

Our solution:

An electronic key cabinet from ecos was able to meet all the city's requirements. The building's listed status was not an obstacle thanks to our „ecos care“ cloud solution: Only a single cable is needed to install the key cabinet. Thus, no elaborate construction measures had to be carried out.

The organisation of the different departments can now be easily carried out thanks to the intelligent rights concept of our software. Individual persons as well as groups can now be granted individual rights and access to different keys. For example, the building yard is given extended access to all building keys so that they can be the first on the site and get to work in the event of an emergency.

The city's employees also benefit from the user-friendliness of the software. Administrators can quickly and easily enter keys, obtain approvals and define different access levels. New employees can also easily familiarise themselves with the software thanks to its simple interface.

Organisation under monument protection. A key management for every building.

The result:

„You can't really do anything wrong because the cabinet thinks for you,“ explains Jens Uhlig from the building construction department. The city administration now benefits in particular from the traceability of its key movements and the simple administration of different access rights for the individual areas.

The user-friendly commissioning of the key management system convinces as well. The installation of the key cabinet, for which a single cable was sufficient thanks to our cloud solution, was particularly relevant for the listed town hall. The structural engineering department is now able to manage all keys efficiently and securely directly on site.

„ The software that came with the key cabinet from ecos is very user-friendly and simple. As a first-time user, it is easy to familiarise yourself with the operation. “
